Lincofarm 110

Premix

Each kg contains:

Lincomycin..... 110g

The disease pressure level at our poultry farms varies according to the management, nutritional status, hygienic conditions and the environment. Broilers are more susceptible to the hazards because of their genetic make up. Lincofarm favours the broilers by amplifying the benefits of their traits as

growth rate and feed conversion. It also gives additional richness to skin colour for consumer appeal as well as the competitive advantage in retail. Lincofarm also controls the dangerous necrotic enteritis at the farms which can kill from 2-50% of the flock

Lincofarm:

Improves rate of weight gain

Improves feed efficiency

Improves pigmentations

Controls necrotic enteritis

Lincofarm 110 should be given thoroughly and evenly mixed with feed...

@20g/ton (2.2 ppm) in broilers and

@20-60g/ton (2.2-6.6 ppm) in layers and breeders.

Available in 1 kg + 5 kg packs
